History and Development AutoCAD has evolved from AutoLISP, originally released in 1970. In 1970, a team at the MITRE Corporation worked with their counterparts at MIT to create a family of programs to aid in the creation of circuits. These programs eventually became known as MIT-built Digital Equipment Corporation (DEC) programs. The DEC programs included a circuit designer and a schematic and layout editor. The software was intended to work in real time on PDP-10 and VAX mainframe computers. In the early 1970s, DEC, having seen that the market for commercial CAD was likely to expand beyond the small office and home CAD market, began to develop a personal computer based system. The system required that the software be designed in a form that could be run on a microprocessor. This led to the creation of the MIT-built DEC products. At DEC, the MIT-built DEC products were named DISCUS. MIT eventually received a share of the royalties from the sale of the DEC products. As a result, the name of the application was changed from DISCUS to DECUS. In 1979, it was decided that the DISCUS products would be rewritten to run on personal computers. This resulted in a new product called COMPUS. During this time, DEC decided to develop their own software as opposed to licensing an existing product, for their new MicroPersonal systems. The company also decided to brand the software product as DOS and not DECUS. A prototype of AutoLISP, which would later be the basis for AutoCAD, was created during this time. In 1982, Autodesk was incorporated and subsequently acquired COMPUS. The name of the product was changed to AutoLISP and the application was moved from DOS to the Macintosh operating system. AutoLISP, in turn, became the basis for AutoCAD. AutoCAD 1.0 was first released in 1988 and was first distributed on a floppy disk. The first major release, AutoCAD 1.1, was released in 1989. For a brief period in the 1990s, Autodesk offered AutoCAD under the "Contract for the Life of the Engineer" (COLLE), where users could pay a single fee for the use of the application for as long as they desired. In the late 1990s, Autodesk began to drop the "Contract for the Life of the Engineer" in favor of a fixed, annual fee. AutoCAD has been consistently sold through

Such electronic devices can include, for example, a local file system (LFS), a web-based personal information manager (PIM), or a separate device, such as a universal serial bus (USB) drive, that can be synchronized with a LFS or a PIM on a smartphone. In some situations, however, an individual may wish to sync an electronic device with a different PIM (for example, a laptop computer

that does not have a local PIM). Current methods of synchronizing an electronic device that is connected to a PIM include, for example, synchronizing the electronic device with the LFS on the PIM. However, when the electronic device is already synchronizing with the LFS, such methods of synchronizing the electronic device with another PIM typically disrupt the synchronization process and/or require a reboot of the electronic device. Accordingly, a system and method for automatically synchronizing a PIM on an electronic device is desired.Q: How to submit JavaScript form and have client-side validation in Django I'm trying to create a POST/Redirect/GET form with JavaScript validation of the inputs.
