JEDI Code Library is a set of tested and fully documented utility functions and non-visual classes. It is built upon code donated from the JEDI community and is reformatted to achieve a common look-and-feel, tested, documented and merged into the library. It has been tested for the use of the Delphi and C++ Builder environments. No external libraries are used, so the library is very easy to integrate into other projects. A common need for the Delphi / C++ Builder developers is the proper handling of strings. The JEDI Code Library provides a set of functions for both strings, arrays, characters and numbers. The developers must consider these functions when integrating the library. The JEDI Code Library provides a set of “unstoppable” classes and standard methods which can be easily reused. It extends the functionality of the standard classes and methods of each system. It does not substitute a standard class functionality. The library is not an alternative of the VCL or the standard classes, but it is intended to complement those classes. Without a doubt, every developer finds himself or herself in need of a set of utility functions. The great power of JEDI Code Library is its ability to provide a set of very well tested, well documented, organized and integrated utility functions.
