

We release new navigation data in accordance with the AIRAC cycle, which is numbered YYNN. update add-ons for other simulators including X-Plane, Prepar3D and FSX. I would like to know what improvements can be made in this update? In particular, is there anything in the aircraft settings to make flying more enjoyable? I found several improvements for the X-Plane simulator, but none for our simulator. Could you give me some advice I've used X-Plane to design some aircraft and I wouldn't call X-Plane amazing. It doesn't do the job, not very well. You can try out Prepar3D, FSX, or your favorite airplane class simulator.
